I want to update the Vercel shipped version to be a generator of custom versions of this for specific customers. The idea is that I could submit a website of a contractor and get back, take a look at their website, find out their location, update the visual look and feel of this to match their branding, update the address and state and such things to match their locations and make this feel like something from them, and then any other details from the website that might update the packages, such things.

We can also just make a lot of the terminology more generic so they don't have things such as Florida specific call outs in the packages and the how to build. We use the logo that they have and their tagline. The idea then is that once that's been scraped and captured somewhere, then there's a parameter I can use for this URL which has the name of the contractor. And if I add that, and there is a config file that we've done, it will load that version of the page or something similar that meets the same needs.

› /compound-engineering:ce-brainstorm I want to update the Vercel shipped version to be a generator of custom versions of this for specific customers. The idea is that I could submit a website of a contractor and get back, take a look at their website, find out their location, update the visual look and feel of this to match their branding, update the address and state and such things to match their locations and make this feel like something from them, and then any other details from the website that might update the packages, such things.

We can also just make a lot of the terminology more generic so they don't have things such as Florida specific call outs in the packages and the how to build. We use the logo that they have and their tagline. The idea then is that once that's been scraped and captured somewhere, then there's a parameter I can use for this URL which has the name of the contractor. And if I add that, and there is a config file that we've done, it will load that version of the page or something similar that meets the same needs.

Ran 5 shell commands

- Reading the demo's structure on this branch so I understand what the generator would be customizing.

Ran 5 shell commands

- Explore(Grounding scout for contractor deck generator) Haiku 4.5
  - └ Backgrounded agent (↓ to manage · ctrl+o to expand)

- A background scout is cataloguing every Zeke's- and Florida-specific piece of the deck. While it works, I'm loading the pressure-test lens so I ask you the right first question.

Ran 1 shell command

## □ Audience

Who opens one of these contractor-branded links, and in what moment?

- › 1. Sales pitch, we drive  
A GoodLeap rep screen-shares or hands over an iPad in a meeting with a prospective contractor. The contractor sees their own brand and pictures using it.
2. Sent to the contractor  
We email or text the link to a prospect contractor ahead of or after a call, and they click through it on their own.
3. Contractor pilots it with homeowners  
The contractor actually walks a real homeowner through their branded deck, so it has to hold up in front of a customer.
4. Mix of the first two  
Used live in pitches and also left behind as a link the contractor can reopen.
5. Type something.

## 6. Chat about this

- Here's the scope I plan to write into the requirements plan, based on your answers.

**What we're building:** A Claude Code command that turns a contractor's website into their own version of the Zeke's deck. The house, photos, and story stay the same; the logo, colours, name, tagline, contact details, and address change to theirs. Each version opens from the existing Vercel link with `?contractor=<name>-<suffix>`. The shared content drops its Zeke's- and Florida-specific wording, so every version reads as that contractor's own, Zeke's included.

I recommend one approach: the command reads the site, writes that contractor's config and logo, and runs a local preview for you to check. After you approve, it redeploys and gives you back the shareable link. Nothing new gets hosted.

Carrying forward: a Claude Code command you run, over a self-serve form for reps. No hosted services.

Carrying forward: packages get renamed and reworded only, over swapping manufacturers. Colours and renders keep matching.

Carrying forward: one set of illustrative prices for every version, Zeke's included, over Zeke's real estimate numbers.

Carrying forward: contractor name plus a random suffix in the URL, over readable names. Prospects can't find each other's decks.

Carrying forward: a bare or unknown link opens Zeke's, over a neutral sample brand. Old links keep working.

Carrying forward: stand-ins for anything the site lacks, over hiding those elements. Every deck looks complete.

Carrying forward: Florida wording becomes generic in every version, over filling in each contractor's state.

Carrying forward: colours and logo only, over also matching fonts.

**What's not in scope:** a self-serve form for reps, per-contractor fonts, manufacturer swaps, new house models or renders, and any connection to the real Merlin app or org settings.

#### Call outs:

- Licence numbers show a neutral placeholder, not an invented number, because a contractor spots a wrong one immediately.
- A contractor's deck must not expose the other contractors' configs. If every config ships in the page code, the random suffix protects nothing.
- For each contractor, the command gives you a list marking every field as taken from their site or a stand-in, so you know what's invented before you send it.
- No images get generated. A missing mascot hides that spot, and a missing jingle falls back to their tagline.
- The homeowner address uses a made-up street in the contractor's home city, the rep is a made-up name, and "prepared on" is the date the version was generated, so no deck looks stale the way the July fixture does now.

If this looks right, confirm and I'll write the requirements plan next from our conversation and this summary. Or tell me what to change, including anything I recorded correctly earlier that you now want different.

\* Waiting for 1 background agent to finish
